

**Amended claims**

5

1. Filter element for a chromatographic column (1),  
comprising
  - a support cage (3) whose contour defines a cylinder  
open on one side, and
  - 10 - a filter (10) which abuts the inside of the support  
cage (3) and defines a hollow space which is open on  
one side,  
the support cage (3) having at its open end a  
substantially annular collar (4),

15 **characterised in that**  
the filter (2) is fixedly joined to the inside of the  
support cage (3).
2. Filter element according to claim 1,  
20 **characterised in that**  
the support cage (3) preferably has, in the region  
adjacent to the collar (4), a sleeve-like portion (6)  
having a closed outer surface, the outside diameter of  
which extends over the outer contour of the support  
25 cage (3).
3. Filter element according to any one of the preceding  
claims,  
**characterised in that**  
30 the support cage (3) has been manufactured from a  
plastics material.

4. Filter element according to any one of the preceding claims,  
**characterised in that**
- 5 the outer contour of the support cage is formed by longitudinal struts (7) as well as at least one annular strut (8).
5. Filter element according to any one of the preceding claims,  
10 **characterised in that**  
the end edges of the support cage (3) are defined by at least one transverse strut (9).
- 15 6. Filter element according to any one of the preceding claims,  
**characterised in that**  
the filter (10) has been manufactured from a paper material.
- 20 7. Filter element according to claim 6,  
**characterised in that**  
the paper material lines the inner contour of the support cage (3) in a single layer.
- 25 8. Chromatographic separating column,  
**characterised in that**  
it has a syringe-shaped column element (2) which is open at one end and is provided at the other end with  
30 a tapered outlet (11) and into which a filter element

(3, 10) according to any one of the preceding claims has been inserted.

5 9. Chromatographic separating column according to claim 8,  
**characterised in that**  
the size of the support cage (3) is such that at least part of its outer surface abuts the inside of the column element (2).

10 10. Chromatographic separating column according to claim 9,  
**characterised in that**  
at least part of the outer surface of the support cage  
15 (3), in particular the sleeve-like portion (6), abuts the inside wall of the column element (2) in a frictionally engaged manner, while the remaining part of the outer surface is at a distance from the inside wall of the column element (2).

20 11. Chromatographic separating column according to any one of claims 8 to 10,  
**characterised in that**  
the collar (4) of the support cage (3) rests on the  
25 open end (5) of the column element (2), the length of the filter element being such that a gap (13) is formed between the closed end face of the support cage (3) and the outlet of the column element (2).

30 12. Chromatographic separating column according to claim 11,

**characterised in that**

chromatography material (12) is provided in the gap (13).

- 5 13. Chromatographic separating column according to any one of claims 8 to 12,

**characterised in that**

the support cage (3), in the region of its open end,  
is joined directly or indirectly to the column element  
10 (2) in an air-tight manner by means of a separate  
sealing element (15) or a sealing element (15) joined  
to the support cage (3).

14. Chromatographic separating device,

15 **characterised in that**

it has a separating column (2) according to any one of  
claims 8 to 13 as well as a device for applying a  
partial vacuum (14) to the outlet (11) of the  
separating column.
